SĀṀKHYA AND NYĀYA CRITIQUE ON *ARTHĀPATTI*

CHAPTER-V

SĀṀKHYA AND NYĀYA CRITIQUE ON *ARTHĀPATTI*

5.1 Sāṁkhya Critique on *Arthāpatti*:

5.1.1 Introduction:

In this section, the view of Sāṁkhyas has been discussed. The main question which is discussed here is whether *arthāpatti* (presumption) is an independent instrument of valid cognition or not? Or to some extent, the question is whether *arthāpatti* (presumption) be reduced to *anumāna* (inference) or not? We have already mentioned that there are three sorts of instrument of valid cognition (*pramāṇa*) accepted by Īsvarakṛṣṇa, *Sūtrākāra* of the Sāṁkhya system, in the first chapter of this research project. They are *dṛṣṭa* (*pratyakṣa*), *anumāna* and *āptavacana* (*āgama* or *śabda*). All objects of cognition can be known only through these three instruments of valid cognition. Furthermore, Sāṁkhyas have reduced the other instruments of cognition in these three instruments of valid cognition. They have reduced *arthāpatti* (presumption) in *anumāna* (inference). In this regard, the present discussion involves the view of Sāṁkhyas, and the next section presents a controversy between Sāṁkhya and Prābhākara schools.

5.1.2 Sāṁkhya view on *Arthāpatti*:

According to Naiyāyikas, *arthāpatti* (presumption) cannot be recognized as a *pramāṇa* (independent instrument of valid cognition), it is nothing but a case of *anumāna* (inference), i.e., *kevala-vyatirekī anumāna*. Vācaspati, like the Naiyāyika, also thinks that *arthāpatti* (presumption) should be treated as a case of *anumāna* (inference). Vācaspati Miśra in his commentary called *Sāṁkhya-Tattvakaumudī*, explains the Sāṁkhya views in this regard.

Vācaspati Miśra says that *anumāna* is three types, viz., *pūrvavat*, *śeṣavat*, and *sāmānyatodṛṣṭa*, and again this classification is divided into two sorts viz. *vīta* and *avīta anumāna*. The *anumāna*, which is dependent on *anvaya vyāpti*, is called *vīta anumāna*. The *anumāna,* which is dependent on *vyatireka vyāpti*, is called *avīta anumāna*. The *vīta anumāna* includes *pūrvavat* and *sāmānyatodṛṣṭa*, and *avīta anumāna* includes *śeṣavat anumāna*. When we infer smoke from the fire is called *pūrvavat* and when we infer sense-organ as instruments from the activity of smelt, taste, etc., is called *sāmānyatodṛṣṭa*. Seeing the waterlogged field, it rained, this kind of inference is called *śeṣavat anumāna*. Again, the *kevala-vyatirekī anumāna* is called as *avīta anumāna*.

The well-known example of *arthāpatti* (presumption): when it is known that Devadatta is alive, but he is not at home, then some inconsistency arises. This inconsistency can be resolved if we assume that he is outside. This type of assumption is called *arthāpatti* (presumption) according to Bhāṭṭa Mīmāṁsakas. However, according to Vācaspati Miśra, Devadatta is a spatio-temporary limited being. It's the general rule of an object that, which is limited by space and time that the absence of it to a certain place implies the presence of the same in the other place. Our body is a living example of this type of object. In this case, the relation of invariable concomitance, which is otherwise called *vyāpti,* can easily be established. The very form of this invariable concomitance stands as follows,

> 'If an object is absent in a place at a particular time, then that object must be present in another place at that time.'

This rule is equally true in the case of Devadatta since he is a person confined within a particular place and time. More clearly, to say, the absence of living in Devadatta in a specific house at a specific time necessarily implies his presence at a particular place outside the house at the same time. Thus, it is seen that the cognition of the presence of Devadatta outside from house is attained through inference, but not through any other instrument of cognition called *arthāpatti* (presumption). The Sāṁkhya philosophers hold that this inference can be formulated in the following way:

> 'Devadatta is outside the house because he is alive and absent from the house.'

The person who is alive and absent from the house is somewhere other than the house, like me. Thus, it is shown that the instrument of cognition called *arthāpatti* (presumption) can very well be reduced to *anumāna* (inference).[131]

5.1.3 Contention between Sāṁkhya and Prābhākara Mīmāṁsā Schools on *Arthāpatti*:

The Prābhākara Mīmāṁsakas have countered this view of the Sāṁkhya. They argue that in the example in question, aliveness accompanied by the absence from the house stands for probans, but in fact, this type of probans cannot be genuine. By the very definition, probans is something which is already known. If the aliveness of Devadatta is taken as the probans who is already known, then the question comes what the instrument by which the aliveness of Devadatta is known. Here, perception cannot be the instrument through which it can be known that Devadatta is alive because we can perceive neither the non-existence of Devadatta in the house nor the existence of Devadatta outside the house. Therefore, to establish the fact that Devadatta is alive, we have resolved to an instrument of valid cognition (*pramāṇa*) other than perception.

However, it is known that the instrument of valid cognition other than perception cannot resolve the doubt. Therefore, the existence of Devadatta outside the house based on the cognition of his absence of him from the house becomes a subject of doubt. In this case, the aliveness of Devadatta itself becomes the subject of doubt, and as it is doubtful, it cannot stand for probans because the probans by the very definition must be free from doubt. Similarly, the existence of Devadatta outside the

---

131 "*evamarthāpattirapi na pramāṇāntaram. tathahi jīvataścaitrasya gṛhāvāvadarśanena vahirbhāvasyādṛṣṭasya kalpanamarthāpattiratimattā vṛddhānām. sā'pyanumānameva. yadā khalvavyapakaḥ sannekatra nāsti tadā'anyatrāsti. yadā'avyāpaka ekatrāsti tadā'anyatrāsti. yadā'avyāpaka ekatrasti tadā'anyatra nāstīti sukaraḥ svaśarīre eva vyāptigrahaḥ. tathā ca sato gṛhābhāvadarśanena liṅgena vahirbhādarśanamanumānameva*."

- Miśra, Vācaspati. *Sāṁkhya-Tattvakaumudī*, Rajat Bhattacharyya (Tr.), Pragatisil Prakasak, Kolkata-73, January, 2011, p. 76.

house also becomes a subject of doubt, and that is why it also cannot stand for probans. Again, the same question recurs: what is the instrument through which the doubts in question can be removed? According to the critics, the existence of Devadatta outside the house cannot be free from doubt before inference, and therefore, the existence of Devadatta outside the house cannot be recognized as probans. Thus, Prābhākara schools established that the instrument of cognition in question is not a case of *anumāna* (inference).

Let us explain the view of Prabhākara in detail in the following way. Prabhākara argues that *arthāpatti* (presumption) as an instrument of valid cognition (*pramāṇa*) is different from *anumāna* (inference) because the process underlines *arthāpatti* (presumption) is diametrically opposed to the process involved in *anumāna* (inference). In *arthāpatti* (presumption), the *upapādya* ('probans' as used in *anumāna*) is supposed to explain the *upapādaka* ('probandum' as used in *anumāna*), whereas, in *anumāna* (inference), it is the probandum that explains the probans. Say, for example, in inference (*anumāna*), the effect, i.e., probans (wetness of the ground), explains its cause, i.e., probandum (a past rain), while in *arthāpatti* (presumption), the probans (non-existence from the house) is explained by the probandum (existence outside the house). So, it is an independent and separate instrument of valid cognition (*pramāṇa*) called *arthāpatti* (presumption). It will be more clear to us when we discuss the view of Nyāya regarding this.

5.2 Nyāya Critique on *Arthāpatti*:

5.2.1 Introduction:

It is already shown that *arthāpatti* (presumption) is being comprehended as an instrument of indirect (*parokṣa*) cognition. This view has been accepted by most of the schools of Indian philosophy including the Nyāya school. However, the fundamental question is about the independence of an instrumentality of *arthāpatti* (presumption). One may raise a question regarding its reducibility to other instruments of valid cognition. For example, it cannot be reduced to perception because of its nature of indirect cognition. It can't be cognized either by testimony or

comparison for obvious reasons. *Arthāpatti* being a *parokṣa* cognition, *anumāna* (inference) can be the possible instrument of *arthāpatti pramā*.

In this section, the Naiyāyika's view on *arthāpatti* (presumption) is discussed following the *Nyāya-Sūtra* along with its commentary and some other important Texts of the Naiyāyikas. It is essential to mention here that Gautama, the founder of the *Nyāya-Sūtra*, has discussed *arthāpatti* (presumption) very clearly in and from verse no. 2-2-1 to 2-2-6 as a valid piece of cognition. However, he along with other Naiyāyikas have denied the independency of its instrument. The fundamental question is whether *arthāpatti* (presumption) is an independent instrument of valid cognition or not? Or to some extent, the question is whether *arthāpatti* (presumption) be reduced to *anumāna* (inference) or not? In response to such questions, it is necessary to discuss *anumāna* (inference). That is why the discussion of *anumāna* (inference) is placed in the next section. With these questions, the present discussion involves a debate between Nyāya and Advaita Vedānta for the reasons mentioned above, and, after that, the emphasis is given to the debate between Nyāya and Bhāṭṭa Mīmāṁsā schools.

5.2.2 Gautama and Vātsyāyana view on *Arthāpatti*:

At the very beginning of the second volume of the second chapter in the *Nyāya-Sūtra*, the great sage Gautama has beautifully propounded *arthāpatti* (presumption). It is well known that Gautama has mentioned four sorts of instrument of valid cognition (perception, inference, comparison, and verbal testimony) in the *Nyāya-Sūtra*.[132] He has also defined four instruments of valid cognition, and after that, he has examined their independence of instrumentality. However, in the very beginning of the second volume of the second chapter in the *Nyāya-Sūtra*, Gautama has said that the instrument of valid cognition (*pramāṇa*) is not only four sorts as the instrumentality of tradition (*aitihya*), presumption (*arthāpatti*), inclusion (*sambhava*)

---

[132] "*pratyākṣānumānopamānaśabdāḥ pramāṇāni*." *Nyāya-Sūtra*: 1-1-3.

and non-existence (*abhāva*) have existed.[133] Now, the *pūrvapakṣī*-s may raise the question that Gautama mentions four sorts of instrument of valid cognition (*pramāṇa*), viz., perception, inference, comparison, and verbal testimony; however, he has not mentioned that they are only four. That is why *pūrvapakṣī*-s raise the question that Gautama may accept the independence of instrumentality of tradition (*aitihya*), presumption (*arthāpatti*), inclusion (*sambhava*), and non-existence (*abhāva*) like the mentioned four instruments of valid cognition (*pramāṇa*) - "*na catuṣṭvāmaitihyārthāpatti-sambhavābhāva-prāmāṇyāt*." That is why *pūrvapakṣī*-s are said that the instrument of valid cognition (*pramāṇa*) is not only four sorts as the instrumentality of tradition (*aitihya*), presumption (*arthāpatti*), inclusion (*sambhava*) and non-existence (*abhāva*) have existed.

Now, the question comes whether Gautama accepts the instrumentality of such instruments of valid cognition (*pramāṇa*-s) as distinct or not? To present the answer to this question, Gautama has separately mentioned this verse no. 2-2-1. The present research is only concentrated on *arthāpatti* (presumption). Moreover, Gautama in his *Nyāya-Sūtra* has given the proper reason for mentioning this verse and wants to oppose the view of the *pūrvapakṣī*-s very vehemently regarding the independency of such instrument of valid cognition (*pramāṇa*).

The commentator of the *Nyāya-Sūtra*, Vātsyāyana, illustrated that *arthāpatti* is called '*arthataḥ āpatti*'. Again, he has mentioned that the meaning of the word '*āpatti*' is *prāpti*, and '*prāpti*' is interpreted as *prasaṇga*.[134] In the case where a specific meaning is said through the sentence, and if what is meant through a sentence other than that meaning what may indicate is called '*prasaṇga*', and the '*prasaṇga*' of meaning out of that is called *arthāpatti* (presumption). To be more specific it is said that *arthāpatti* (presumption) is the entailment of one affair from the proclamation of another affair. It is *arthāpatti* as it is the intended affair which is other than the mentioned affair. Here the commentator Vātsyāyana exemplifies *arthāpatti* as "*yathā*

---

[133] "*na catuṣṭvāmaitihyārthāpatti-sambhavābhāva-prāmāṇyāt*." *Nyāya-Sūtra*: 2-2-1.

[134] "*arthādāpattirarthāpattiḥ, āpattiḥ prāptiḥ prasaṇgaḥ*." *Nyāya-Sūtra-Bhāṣya*: 2-2-1.

megheṣvasatsu vṛṣṭirna bhavatīti"[135], that is 'unless there is cloud there is no rain', and from that, it entails that 'there is rain if there is cloud'. So, the realization of rain if there is a cloud, is called *arthāpatti* (presumption), and the instrument of such cognition is also *arthāpatti* (presumption). The main point is that the assumption of something in respect of another is called *arthāpatti* (presumption).

There is no doubt that from the meaning of the sentence 'unless there is cloud, there is no rain', and that meaning, the cognition 'there is rain if there is cloud' is not possible through *pratyakṣa* (perception). The cognition of 'there is rain if there is cloud' is not also possible through *anumāna* (inference) as there is no cognition of invariable concomitance (*vyāpti-jñāna*) which is the supporting grounds for inference. Moreover, the cognition of 'there is rain if there is cloud' may not be an utterance of any trustworthy competent person. This is why such type of cognition may not be produced through *śabda pramāṇa* (verbal testimony). But the sentence meaning of 'there is rain if there is cloud' is understood when it is said that 'unless there is cloud, there is no rain'. This sentence meaning is produced through the '*āpatti*' or '*prāpti*' of the 'unless there is cloud there is no rain'. Therefore, the cognition of 'there is rain if there is cloud' is called *arthāpatti* (presumption). The well-known example of *arthāpatti* (presumption) of the Mīmāṁsakas is: stout Devdatta does not eat food during day time. Here, the assumption of his eating food at night is called *arthāpatti* (presumption). In this case, it is '*āpatti*' or '*prāpti*' (impossible) for a person to be fat if he does not eat at all.

Now, in the next verse, Gautama has said that the rest four instruments of valid cognition (*pramāṇa*-s) viz. tradition (*aitihya*), presumption (*arthāpatti*), inclusion (*sambhava*), and non-existence (*abhāva*) are not independent instruments of valid cognition. Here, the great sage Gautama has clearly mentioned that the instrumentality of tradition (*aitihya*) is included in *śabda pramāṇa* (testimony), and the instrumentality of presumption (*arthāpatti*), inclusion (*sambhava*) and non-

---

[135] *Nyāya-Sūtra-Bhāṣya*: 2-2-1.

existence (*abhāva*) are included in *anumāna pramāṇa*.[136] Though the logician, Varadrāja, says that non-existence (*abhāva*) may be included in perception (*pratyakṣa*) also. However, *arthāpatti* (presumption) is not an independent instrument of valid cognition as it is reduced to *anumāna pramāṇa* (inference).

The cognition for the case of *anumāna* (inference) moves from perceived fact to unperceived fact through invariable concomitance (*vyāpti*). According to Gautama, likewise, cognition for the case of *arthāpatti* (presumption), also runs from perceived fact to unperceived fact.[137] Therefore, according to Nyāya, *arthāpatti* (presumption) is reduced to *anumāna* (inference) as it is covered by the definition of *anumāna* (inference). The assumption of something from the cognition of a negative sentential meaning, which produces the positive sentential meaning, is called *arthāpatti* (presumption), like *anumāna* (inference).[138] When someone says any sentence and the sentence refers to the cognition of another meaning which is not mentioned earlier due to the opposite meaning is called *arthāpatti* (presumption), which is called *śrutārthāpatti* as per Bhāṭṭa views. The cognition of rain from the cloudy sky is produced through the sentence 'unless there is cloud, there is no rain'. The cognition 'there is rain if there is cloud' is not mentioned in this sentence 'unless there is cloud there is no rain'. However, it is understood from the sentential meaning of the mentioned sentence. In this case, the cognition of 'unless there is cloud' contradicts the cognition of 'there is cloud', and same as the cognition of 'there is no rain' is contradict the cognition of 'there is rain' as there is preset the opposite standpoint with each other. That is why the commentator, Vātsyāyana, has mentioned in his commentary the term '*pratyanīkabhāvāt*'. The meaning of the term '*pratyanīka*' is contradictory. Such types of cognition created through contradiction are called

---

136 "*śabda aitihyānarthāntarabhāvādanumāne'rthāpattisambhavābhāvānarthāntarabhāvāccāpratiṣedhaḥ*." *Nyāya-Sūtra*: 2-2-2.

137 "*pratyakṣeṇāpratyakṣasya samvandhasya pratipattiranumānaṁ, tathā cārthāpattisambhavābhāvāḥ*." *Nyāya-Sūtra-Bhāsya*: 2-2-2.

138 "*vākyārthasaṁpratyayenānabhihitasyārthasya pratyanīkabhāvādgrahaṇamarthāpattiranumānameva*." Ibid.

arthāpatti (presumption); it is also called as well as *anumāna* (inference). For the case of *anumāna* (inference), the cognition is generated as: 'unless there is a cloud there is no rain', therefore, 'there is rain if there is a cloud'. That is to say, the cloud is the cause of rain. The commentator does not say that *arthāpatti* (presumption) is not the cognition of cloud from the rain. The cognition of the fact, which is not previously known, is created from the cognition of sentential meaning and is called, according to the commentator, *arthāpatti* (presumption) as well as *anumāna* (inference). It is essential to point out that Bhāṭṭa Mīmāṁsakas have accepted such type of conflict as an apparent conflict whereas Vātsyāyana has mentioned it as conflict only. There is a contradiction between the Bhāṭṭa Mīmāṁsakas and the Naiyāyikas which is clearly discussed in section 5.2.5 of this research work.

The aforementioned case can be applied in the most familiar example of *arthāpatti* (presumption): 'the assumption of Devadatta eats in the night time' is produced through the cognition of 'stout Devadatta does not eat food during the day time'. The fact of his eating during the night time has not been clearly explained however is resolved from this discretion that a person who does not eat during day time cannot be stout unless he eats in the night time. Here, 'stout Devadatta does not eat food during the day time' is the perceivable fact, and 'he eats in the night time' is the case of unperceivable fact. In *anumāna* (inference) also, we infer from perceived fact to unperceived fact. That is why the commentator of *Nyāya-Sūtra* says that *arthāpatti* (presumption) like *anumāna* (inference) passes from a perceived fact to an unperceived fact since they are linked in some way. However, there is a fundamental difference between *arthāpatti* (presumption) and *anumāna* (inference) regarding the process of two cognitions which is highlighted in this chapter.

Gautama has accepted the *arthāpatti* (presumption) as a valid piece of cognition. However, somebody may say that *arthāpatti* (presumption) cannot be an instrument of valid cognition (*pramāṇa*) due to its uncertainty. Gautama has mentioned the objection of *pūrvapakṣī*-s in the verse no. 2-2-3 as *arthāpatti* (presumption) is not a valid one because it leads to uncertainty.[139] It is well-known that uncertainty is not a valid piece of cognition. The example given by the

---

[139] "*arthāpattirapramāṇamanaikāntikatvāt*." *Nyāya-Sūtra*: 2-2-3.

commentator presents this uncertainty where Vātsyāyana is said that we assume 'if there is a cloud there will be rain' from the sentence 'if there is no cloud there will be no rain'. However, it often happens that a cloud is not followed by rain. That is why *arthāpatti* (presumption) does not always lead to certainty. Therefore, *arthāpatti* (presumption) is not a valid piece of cognition.

Gautama has refuted the objection as mentioned above. According to Nyāya, wherever the cause is absent, the effect cannot be produced. It is also entailed that the effect must be produced if there will be a cause. Actually, the assumption is that if there is rain, there must have been a cloud. Here, the antecedent is rain, and the consequent is cloud. Wherever is rain, there also has been the cloud. But, the *pūrvapakṣī*-s have failed to understand this truth. To pretend others, they explain the example of the assumption that 'if there is a cloud, there will be rain' although the presence of a cloud does not ascertain rain. Here, the pretended example is a case of *pramāṇābhāsa* (*pseudo-cognition*) because of the presence of exceptional cases. That is why the objection that there is uncertainty for the cognition of *arthāpatti* (presumption)[140]does not sustain.

Again, it is said by Gautama that the objection as mentioned above against *arthāpatti* (presumption) is itself invalid as it leads to uncertainty[141]. There are two shorts of consideration, viz., one is about the validity of *arthāpatti* (presumption), and another is about the function of *arthāpatti* (presumption). The objection of the *pūrvapakṣī*-s is regarding the validity of *arthāpatti* (presumption). However, they do not raise any questions regarding the function of *arthāpatti* (presumption). That is why it is said that the function of *arthāpatti* (presumption) is accepted by *pūrvapakṣī*. Moreover, it is a general view that whatever is raised on one aspect of the subject, i.e., either validity or its function, the view is itself uncertain. The objection raised by *pūrvapakṣī*-s is itself affected by the fallacy of uncertainty as it is raised only for the validity of *arthāpatti* (presumption).

---

[140] "*anarthāpattāvarthāpattyabhimānāt*." *Nyāya-Sūtra*: 2-2-4.

[141] "*pratiṣedhāprāmāṇyañcānaikāntikatvāt*." *Nyāya-Sūtra*: 2-2-5.

Furthermore, Gautama says that if the view of the *pūrvapakṣī*-s is a valid one, the claim of invalidity of *arthāpatti* (presumption) cannot be raised.[142] Gautama says that the case where the uncertainty of the subject is not present is called *pramāṇa*. This principle of inference is also present for all instances of *arthāpatti* (presumption). Thus, there is no scope of uncertainty in the case of *arthāpatti* (presumption) according to Gautama. The commentator, Vātsyāyana, also says that the assertion of effect from its cause will not lead to uncertainty, and this is the subject of *arthāpatti* (presumption). But it is not the subject of *arthāpatti* (presumption) that ineffectiveness of effect is the property of the cause. The subject of *arthāpatti* is not about that if there is a cloud, there will be rain. Instead, it is like that if there is rain, there must have been a cloud. It is not possible that there is rain but not have been a cloud. This alone is the subject of *arthāpatti* and which is obviously certain. Therefore, Gautama has claimed that one should accept the cognition of *arthāpatti* as a valid one. However, he has denied the independency of the instrumentality of *arthāpatti* (presumption) and reduced it to *anumāna* (inference).[143]

If we have closely scrutinized the view of Vātsyāyana on *arthāpatti* (presumption), it will be seen that the view is not so strong. Moreover, Gautama has not been able to bring in light on *arthāpatti* (presumption) in the same way that he has skilfully discussed the other four *pramāṇa*-s, viz., *pratyakṣa*, *anumāna*, *upamāna,* and *śabda*. There is also some sort of vagueness. He has not shown the invariable concomitance (*vyāpti*) in the case of *arthāpatti* (presumption) rightly what he has claimed. First of all, the Commentator, Vātsyāyana, says 'unless there is cloud there is no rain', and from that, it entails that 'there is rain if there is cloud'. If we rearrange such type of example in logical form, then the form is $\sim C \supset \sim R$, it entails $C \supset R$. But, the entailment of $C \supset R$ is not a proper one[144]. Here, the commentator has remained in a dilemmatic position. Because first, he has said the form of *arthāpatti*

---

[142] "*tatprāmāṇye vā nārthāpattyaprāmāṇyaṁ*." *Nyāya-Sūtra*: 2-2-6.

[143] "*pratyakṣeṇāpratyakṣasya sambandhasya pratipattiranumānaṁ, tathā cārthāpattisambhavābhāvāḥ*." *Nyāya-Sūtra-Bhāṣya*: 2-2-2.

[144] Here, 'C' stands for cloud, and 'R' stands for rain.

(presumption) is like ~ C ⊃ ~ R, it entails C ⊃ R due to his mentioned feature of *arthāpatti* (presumption) is '*pratyanīkavābāt*'. Again, to avoid the uncertainty of the mentioned example, he has said ~ C ⊃ ~ R, and it entails R ⊃ C. This type of form is called transposition which is the rule of replacement in Western Logic, and in that rule, nothing (no content of cognition) is added to our cognition apart from the form of a new sentence. It differs from the original opinion about *arthāpatti* (presumption). However, nothing can be produced from negation. But, the given example of *arthāpatti* is taken from negation which is not logically justifiable. That is why the position of Vātsyāyana is not a proper one.

Now, the logical form C ⊃ R is denoted that there is rain if there is cloud. However, the cloud is a necessary condition of rain, but not sufficient. The effect is the sum total of the causes and the absence of obstacle. If there is an obstacle, then the effect should not be produced. Here, the commentator fails to understand the obstacle. That is why the problem arises and he says 'unless there is cloud there is no rain', and from that, it entails that 'there is rain if there is cloud'.

5.2.3 A Critical view on *Anumāna*:

In the present discussion, we will talk about the background for discussing *anumāna* (inference) in the current work. We have already mentioned earlier that some schools of Indian philosophy do not accept *arthāpatti* as a distinct instrument of valid cognition. Though, they have accepted the cognition of *arthāpatti*. Naiyāyikas do not accept *arthāpatti* as a distinct instrument of valid cognition; although, they reduce it in *kevala-vyatirekī anumāna*. This seems to recommend some discussion on *vyāpti*, and *kevala-vyatirekī anumāna* following Nyāya and Mīmāṁsaka view on the same in the upcoming discussion.

It is already mentioned that there are different epistemological tools to know reality. Among them, *anumāna* (inference) is one of the independent instruments of valid cognition. All of the *āstika* (orthodox) schools unanimously accepted *anumāna* (inference) as a valid source of cognition, though diverse opinions were found regarding the nature of *anumāna*. As we know, *anumāna* is dependent on *pratyakṣa*

(perception), so it is called a mediate (*parokṣa*) instrument of valid cognition. *Pratyakṣa* (perception) is not reliant on any other instrument of valid cognition; that is why it is called an immediate (*aparokṣa*) instrument of valid cognition. Most of the Indian philosophers distinguish *anumāna* (inference) from *anūmiti* (inferential cognition). They accept *anumāna* (inference) as an instrumental cause and *anumiti* (inferential cognition) as the resultant cognition of *anumāna* (inference). Though thinkers such as Kaṇāda, and Praśastapāda, do not distinguish between *anumāna* and *anumiti* and they consider it as cognition, i.e., *anumiti*[145].

5.2.3.1 Nyāya view on *Anumāna*:

The great sage Gautama classifies *anumāna* (inference) in his *Nyāya-Sūtra* instead of presenting separate *Sūtra*-s for definition and classification, presents a *Sūtra* having definition-cum classification on *anumāna*. There are opinions that Gautama defines *anumāna* (inference) while stating the term '*tat*' in his *Sūtra* and stating '*tat*' refers to that inference preceded by *pratyakṣa* (perception).[146] Vātsyāyana, the commentator of *Nyāya-Sūtra,* explains the pronoun '*tat*' used by Gautama as "'*tatpūrvvaka'mityanena liṅgaliṅginoḥ sambandhadarśanaṁ liṇgadarśanaṁcā'bhisambadhyate*"[147]. There are having two characteristics as stated in the *Bhāṣya* of this *Sūtra*: a) the perception of the invariable concomitance between the probans (*liṅga*) and the probandum (*liṅgi*), and b) the perception of the probans (*liṅga*) in *pakṣa*. Here, the probans (*liṅga*) may mean proper reason (*sadhetu*), which is employed in inference, and the probandum (*liṅgi*) is inferred object to be established employing probans. It is a case of co-existence between the probans and

[146] "*atha tatpūrvvakaṁ trividhamanumānaṁ purvavvaccheṣavat sāmānyato dṛṣṭaṁca*". *Nyāya-Sūtra*: 1-1-5.

[147] Tarkabagish, Mahamahopadhyaya. Phanibhusan. *Nyāyadarśan-Batsyāyana Bhāṣya*, Vol. I, West Bengal State Book Board, Kolkata, 2011, p. 152.

the probandum (i.e., wherever there is probans, there is probandum) on the same locus. The probans is called pervaded (*vyāpya*), and the probandum is called perveder (*vyāpaka*). So, the relationship between probans and probandum is the relation of 'the *vyāpya-vyāpaka-bhāva*', i.e., *vyāpti* (invariable concomitance). Vātsyāyana states the remembrance of the probans (*liṅga-smṛti*) through the perception of the invariable concomitance between probans and probandum without any observation of exceptional case, the cognizer inserts the non-perceptual probandum.[148] Uddyotakar then explains Vātsyāyana's concept of inference further. According to Uddyotakara, when someone first perceives the invariable concomitance between the probans (smoke) and the probandum (fire), and again he perceives probans (smoke on the mountain) in a subject and recalls the pervaded-pervader relation between the two, and thereby only by cognizing the presence of probans (smoke) qualified by the pervaded-pervader relation, he can infer the probandum (fire)[149]. To explain further, we can state that when someone perceived smoke and fire in different places like the kitchen; can have the cognition of invariable concomitance between these two as wherever there is smoke (probans), there is fire (probandum). This sort of perception of probans is called *pratham-liṅgaparāmarśa*. Keeping the cognition of *pratham-liṅgaparāmarśa*, someone again perceives smoke in some other place like a mountain, i.e., *pakṣa*. This perceptual cognition, i.e., the smoke is on the hill ('*dhūmavān parvataḥ*') is called by *Navya*-Naiyāyika as *pakṣadharmatā*, i.e., *dvitīya-liṅga-parāmarśa*. After the *dvitīya-liṅga-parāmarśa*, when the same person remembers the cognition of invariable concomitance and again perceives smoke which is invariably related to fire and thereby asserts its existence on the mountain. At this stage, inferential cognition of fire is possible and regarded as *tṛtīyā-liṅga-parāmarśa* or *liṅga-parāmarśa* or *parāmarśa*, i.e., the confirmatory cognition.

Uddyotkara, a *Prācīna* Naiyāyika, have introduced the concept of *parāmarśa* (the confirmatory cognition), and later on, most of the Naiyāyikas followed it. It is the

---

[148] "*liṅga-liṅginoḥ sambandhayordarśanena liṅgasmṛtirabhisambadhyate. smṛtyā liṅgadarśanena cāpratyakṣo'rtho'numīyate*". Ibid., p. 152.

[149] "*liṅga-liṇgi-sambandha-darśanaṁ ādyaṁ pratyakṣaṁ liṅgadarśanaṁ dvitīyaṁ. Vubhutsāvato dvitīyaliṅga-darśanāt saṁskārābhivyakty uttarakāle smṛtiḥ smṛti antaraṁ ca punar liṅga-darśanamayaṁ dhūma iti*". *Nyāya-Vārttika*, p. 134.

process after which inferential cognition (*anumiti*) is immediately produced. Gaṅgeśa, a *Navya*-Naiyāyika, also refers to *parāmarśa* (the confirmatory cognition) as the instrumental cause (*vyāpāra*) of inferential cognition. The *parāmarśa* (the confirmatory cognition) is a complex cognition that arises from the combination of two cognition, i.e., *vyāpti* (invariable concomitance between probans and probandum) and *pakśadharmatā*.

However, a question may arise: what is *pakśadharmatā*? The cognition about the existence of probans on the *pakṣa* is called *pakśadharmatā*.[150] The perception of the smoke on the mountain ('*dhūmavān parvataḥ*') is *pakśadharmatā.* In the case of *parāmarśa* (the confirmatory cognition), we do perceive the same probans (smoke) in the *pakṣa* (mountain), but the smoke is qualified by invariable concomitance between smoke and fire.[151] The difference between *pakśadharmatā* and *parāmarśa* is that *pakśadharmatā* is devoid of the qualification of *vyāpti* (invariable concomitance), whereas *parāmarśa* is qualified by *vyāpti* (invariable concomitance). There is a controversy among different Naiyāyikas regarding the instrumentality of inferential cognition. *Navya* Naiyāyikas accept *vyāpti* as an instrumental cause of inferential cognition, and *Prācīna* Naiyāyikas are in favor of accepting *parāmarśa* as the instrumental cause of inferential cognition (*anumiti*). We are not going to get into the controversy of the instrumental cause of inferential cognition.

5.2.3.2 Mīmāṁsā view on *Anumāna*:

The great sage Jaimini, the systematic founder of the *Mīmāṁsā-Sūtra*, does not give any epistemological discussion in his *Sūtra* while discussing metaphysics, sometimes he has mentions inference as a tool (for establishing the *Vedic* rituals). But, the commentator Śabara speaks on inference in his commentary (*Śabara-Bhāṣya*). Śabara defines *anumāna* (inference) as when the perception of the relation of one word and its meaning leads to the cognition of the relation of other words and its

---

[150] "*vyāpyasya parvatādivṛttitvam pakṣadharmatā*." *Tarkasaṁgraha*: 51.

[151] "*vyāptiviśiṣṭapakṣadharmatājñānam parāmarśaḥ*." *Tarkasaṁgraha*: 49.

corresponding meaning based on a well-known relationship (invariable concomitance), that later relationship is not in contact with the person's sense-organs and in that case the second cognition is called *anumāna* (inference).[152] This definition directly indicates that invariable concomitance (*vyāpti*) has a vital role in *anumāna*. This definition would be the only ground for both Kumārīla's and Prabhākara's opinions on *anumāna*, though their views differ from each other.

Nārāyaṇa Bhaṭṭa, a Bhāṭṭa Mīmāṁsaka, says the definition of *anumāna* in his *Mānameyodaya* as "*vyāpyadarśanād'sannikṛṣṭārthajñānamanumānam. yathā parvate dhūmavattvadarśanādagnimattvajñānam…*"[153]. It means that the cognition of what is not contiguously resulting from the perception of what pervaded is *anumāna* (inference). Say, for example, when someone perceives the mountain as having smoke and certainly assert the cognition of the hill having fire. This definition also emphasizes *vyāpti* by the term '*vyāpyadarśana*'. The perception of probans in the *pakṣa* is called *pakṣadharmatā*, and the invariable relationship between pervaded and pervader is called *vyāpti*. So, the cognition of *pakṣadharmatā* and *vyāpti* are the causes of inferential cognition. Here, the *Prācīna* Naiyāyikas accept *parāmarśa* (confirmatory cognition) as the instrument of inferential cognition. Whereas, the *Navya* Naiyāyikas accept *vyāpti* (invariable concomitance) as the instrument of inferential cognition. It is essential to note that, Mīmāṁsakas and Advaitins do not accept the occurrence of *parāmarśa* for the emergence of inferential cognition (*anumiti*). They accept *vyāpti* (invariable concomitance) as the instrument of inferential cognition. Like the Naiyāyikas, the Mīmāṁsakas also have a diverse opinion on the nature of *vyāpti*. Regarding the definition of *vyāpti*, he states "*svābhāvikaḥ sambandho vyāptiḥ*, *svābhāvikatvaṁ ca upādhirāhityam…*"[154]. The natural relation is called *vyāpti*, and by 'natural', he refers to that which is free from extraneous adjunct (*upādhi*). The relationship between smoke and fire is natural, so

---

[152] "*anumānaṁ jñātasambandhasyaikadeśadarśanād ekadeśāntare'sannikṛṣṭe'rthe buddhiḥ*". *Śabara-Bhāṣya*: 1-1-5.

[153] *Mānameyodaya*: 22-1, p. 46.

[154] Ibid. 23-2, p. 48.

this relationship is called *vyāpti*. In other words, this relationship is free from any extraneous adjunct (*upādhi*). '*Upādhi*' is defined as that which is coextensive with the *sādhya* but less extensive with the *sādhana*.[155] When someone speaks of the relationship of fire (*sādhana*) with smoke (*sādhya*), such relation is not entitled to be called *vyāpti*, because it depends on an extraneous adjunct like wet fuel, i.e., *upādhi*. To illustrate, we could say that fire associated with wet fuel is always in companion with smoke (*sādhya*), but bare fire (*sādhana*) is not always in companion with smoke. Similarly, the relation between *hiṁsātva* (killing) and *adharmatva* (sin) is not *vyāpti* due to *upādhi* (as *niṣiddhatva*). Mīmāṁsakas believe that the act which is prohibited in the scriptures is called sinful. Hence, killing is not always sinful. Only those forms of prohibited killings commit a sin which is performed other than religious purposes. So, the literal meaning of *upādhi* is an extraneous adjunct, that is, unnecessary and irrelevant to natural relations. The natural relation between probans and probandum is also devoid of extraneous adjuncts and is called *vyāpti*.

5.2.3.3 Advaita Vedānta view on *Anumāna*:

Vedānta-Paribhāṣā is the monograph to know the epistemological view of Advaitins at par with the Naiyāyikas epistemology giving a sound basis to its own metaphysical standpoint, which is marvelous in precision and analysis. Moreover, we can preciously know on *anumāna* of Advaitins through the book *Vedānta-Paribhāṣā*. To quote D. M. Datta holds, "The only systematic account of anumāna [*anumāna*] according to the Advaita school is to be found in the Vedānta-paribhāṣā and its commentaries".[156]

All of the Indian schools, except Cārvāka, have unanimously accepted that *vyāpti* plays a vital role in the emergence of inferential cognition (*anumiti*). That is why Advaitins have defined inferential cognition based on *vyāpti*, an invariable concomitance between probans and probandum. One cannot know the inferential

---

[155] "*sādhanāvyāpakatve sati sādhyasamavyāpta upādhiḥ iti tasya lakṣaṇam*". Ibid. 24-3, p. 50.

[156] Datta, D.M. *The Six Ways of Knowing*, University of Calcutta, 2014, p. 171.

cognition (*anumiti*) without knowing the instrument of *anumiti* what is called *anumāna*. That is why Dharmarājā Adhvarīndra defines inferential cognition (*anumiti*) in his *Vedānta-Paribhāṣā* at first, "*anumitiśca vyāptijñānatvena vyāptijñāna-janyā*". That is: the inferential cognition (*anumiti*) is produced by the cognition of invariable concomitance (*vyāpti jñāna*) limited by the limitor of invariable concomitance (*vyāpti-janyatva*).

In the definition of inferential cognition (*anumiti*), it is seen that the term '*vyāpti-jñāna*' has been used twice. Otherwise, that would commit the fallacy of over-coverage (*ativyāpti-doṣa*) concerning *anuvyavasāya* of *vyāpti-jñāna*, *vyāpti smṛti,* and *vyāpti dhvaṁsa* if the term '*vyāpti-jñānatva*' is not employed in the *lakṣaṇa* of *anumiti*. Apart from the inferential cognition is produced by the cognition of invariable concomitance, there are three cases that are also produced through the cognition of invariable concomitance, viz., apperception[157] of the cognition of invariable concomitance (*anuvyavasāya* of *vyāpti-jñāna*), recollection of the invariable concomitance (*smṛti* of *vyāpti-jñāna*), and destruction of the invariable concomitance (*dhvaṁsa* of *vyāpti-jñāna*). Now apperception etc. of the cognition of invariable concomitance (*vyāpti-jñāna*) are not inferential cognition as they are not produced by the cognition of invariable concomitance as such[158]. However, in the case of inferential cognition, the cognition of invariable concomitance (*vyāpti-jñāna*) is produced as such, i.e., invariable concomitance. That is why the term '*vyāpti-jñāna*' is used twice in the definition of inferential cognition (*anumiti*).

The Naiyāyikas have accepted *parāmarśa* (confirmatory cognition) as the instrument for inferential cognition. However, the philosophers of the Advaita Vedānta school do not accept *parāmarśa* as a condition for inferential cognition. They have accepted the cognition of invariable concomitance (*vyāpti-jñāna*) as an instrument (*karaṇa*) of inferential cognition, and impression (*saṁskāra*) of that

---

[157] The cognition, "This is a table", is a perception, while the perception, "I know the table", is an apperception.

[158] "*vyāptijñānānuvyavasāyādestatvena tajjanyatvābhāvānnānumititvam*". *Vedānta-Paribhāṣā*, pp. 130-133.

invariable concomitance as an intermediate cause (*vyāpāra*) of inferential cognition[159]. The *Prācīna* Naiyāyikas accept *parāmarśa* (the confirmatory cognition) as an instrument of inferential cognition. However, Advaita Vedāntins argued that the failure of the qualified invariable concomitance with the probans of the subject is the proof of non-occurrence of *parāmarśa* in inferential cognition.[160] Because, according to Naiyāyikas, cognition, desire, etc., are the special characteristic of self (*ātmā*) and are also momentary in nature existing up to the second moment and destroyed in the third moment and again, two different cognitions cannot be produced at the same time. The *parāmarśa* (the confirmatory cognition) is a complex cognition that arises from the combination of two cognition, i.e., *vyāpti* (invariable concomitance between probans and probandum) and *pakśadharmatā*.[161] Let us note the sequence of cognition that takes place throughout the Naiyāyikas notion of inferential cognition. In the case of origination of *parāmarśa*, first, we see the presence of smoke (probans) in a kitchen, etc., which is technically called by Indian logicians as *pakṣadharmatā jñāna*, second, we remember that smoke is never without fire (probandum) that is called *vyāpti-smṛti*, and thirdly we consider that the smoke is in the hill (*pakṣa*) pervaded by fire and the fire (probandum) is to be inferred. Here, we see that the *parāmarśa* is produced in the moment of the third step of inferential cognition. Advaita Vedāntins, on this point, argued that any cognition is existent for the duration of only two moments, and the third moment that cognition is destroyed. Therefore, *parāmarśa* (the confirmatory cognition) can't be produced as per the Naiyāyika's own consideration. This is why Advaita Vedāntins has denied the occurrence of *parāmarśa*[162], and accepted *vyāpti-jñāna* and *pakṣadharmatā jñāna* as two separate conditions of inferential cognition.

---

159 "*anumiti-karaṇañca vyāpti-jñānam. tat-saṁskāro'vantaravyāpāraḥ*". *Vedānta-Paribhāṣā*, pp. 133-135.

160 "*tasyānumiti-hetutvāsiddhyā*." Ibid.

161 "*vyāptiviśiṣṭa-pakṣadharmatā-jñānaṁ parāmarśaḥ*." *Tarkasaṁgraha*: 49.

162 "*na tu tṛtīya-liṅga-parāmarśo'numitau karaṇam*." Ibid., p. 135.

Now, let us discuss the definition of *vyāpti* according to Advaita. To define the *vyāpti* Dharmarājā Adhvarīndra says in his *Vedānta-Paribhāṣā*, "*vyāptiścāśeṣa-sādhanāśrayāśritasādhya-sāmānādhikaraṇyarūpā*."[163] *Vyāpti* (invariable concomitance) is the co-existence of probandum with the probans that must abide in all substratum of the probans.

5.2.3.4 Controversy on Numbers of *Avayava*:

Like Naiyāyikas, Mīmāṁsakas and Advaita Vedāntins also accepts two sorts of inferential cognition, viz. *svārthānumiti* and *parārthānumiti*. *Svārthānumiti* is only for one's own sake, and *parārthānumiti* is for others' sake. The basis of this classification is for which purpose the cognition is produced. To illustrate *parārthānumiti* is an art of presenting arguments to others through numbers of inferential statements (*avayava*-s) so that others can have the cognition of the same as it is known by the person presenting the argument (having *svārthānumiti jñāna*).

However, among the schools mentioned above, there are two different views regarding the numbers of inferential statements (*avayava*-s) required for *parārthānumiti*, viz., one is the view of the Naiyāyikas, and the other is the view of the Mīmāṁsakas and the Advaita Vedāntins. According to the Mīmāṁsakas and Advaita Vedāntins, there are three numbers of inferential statements (*avayava*-s) related to *parārthānumiti*, viz. either *udāharaṇa-vākya*, *hetu-vākya* and *nigamana-vākya*; or *pratijñā-vākya*, *hetu-vākya*, and *udāharaṇa-vākya*. The following example will help for better understanding:

Whatever has smoke, has fire, e.g., kitchen, etc. (*udāharaṇa-vākya*);

The hill has smoke (*hetu-vākya*);

Therefore, the hill has fire (*nigamana-vākya*).

Or,

---

[163] Ibid., p. 141.

The hill has fire (*pratijñā-vākya*);

Since it has smoke (*hetu-vākya*); and

Whatever has smoke, has fire, e.g., kitchen, etc. (*udāharaṇa-vākya*).

But, according to Naiyāyikas, there are five numbers of inferential statements (*avayava*-s) instead of three numbers of a statement to have the inferential cognition for others sake, viz., *pratijñā-vākya*, *hetu-vākya*, *udāharaṇa-vākya*, *upanaya-vākya*, and *nigamana-vākya*. For instance,

The hill has fire (*pratijñā-vākya*);

Since it has smoke (*hetu-vākya*);

Whatever has smoke, has fire, e.g., the kitchen (*udāharaṇa-vākya*);

The hill has smoke (*upanaya-vākya*);

Therefore, the hill has fire (*nigamana-vākya*).

Even though, the Mīmāṁsakas and Advaita Vedāntins have rejected the Naiyāyika's five-inferential statements (*pañca-avayava*-s) on the ground of unnecessary repetition and non-occurrence of cognition like *liṅga parāmarśa*. We know that logical cumbrousness (*gaurava*) is a faulty judgment and that is accepted by the Naiyāyikas also. If something can well be described in a specific setting, then a more extensive setup should be avoided. For instance, we can say if the process of inferential cognition is possible through three components of statements, then it is unnecessary to accept five components of inferential statements. Here, we memorize *vyāpti* in the field of inferential cognition. Mīmāṁsaka does not accept memory as invalid because its cognition is not like the illusion of silver in the shell. According to them, memory is also a source of cognition if it produces through the first experience, which is faithful. However, it is not a valid cognition (*pramā*) as it does not give any new cognition. The conclusion of inferential cognition is valid because the inferential statements are true.

Naiyāyikas accept five numbers of inferential statements (*avayava*-s) for inferential cognition. However, one may claim that *pratijñā-vākya* is not different from *nigamana-vākya* and again *hetu-vākya* is not different from the *upanaya-vākya*. Therefore, two *vākya*-s may be removed from the list of components of *parārthānumiti*. Now, a question may arise, is it necessary to restate these two *vākya*-s which are proposed to be removed from the list of components of statements required for *parārthānumiti*? A possible answer has been given by Naiyāyikas that the third *avayava*, *udāharaṇa-vākya*, is a memory judgment. We already know that memory is not an apprehension (*anubhava*). But if we derive a conclusion after the *udāharaṇa,* that would also make a memory judgment. And memory could be accepted as the instrument (*karaṇa*) of inferential cognition. But we know it is impossible to claim so, as memory is not an apprehension (*anubhava*). That is why Naiyāyikas have admitted the *upanaya-vākya* after *udāharaṇa-vākya* as *upanaya-vākya* is the hybrid combination of *hetu-vākya* and *udāharaṇa-vākya*.

However, the presentation of *upanaya-vākya* is not necessary in the case of *parārthānumiti* as such type of *vākya* indicates *liṅga parāmarśa*. The Mīmāṁsaka and Advaita Vedānta schools didn't accept *liṅga parāmarśa* as a condition of inferential cognition. According to them, there is not any necessity to accept *liṅga parāmarśa* in the field of inferential cognition. The cognition of *vyāpti* and the *pakṣadharmatā* are the conditions to generate inferential cognition. This is why the presentation of *upanaya-vākya* is not necessary for the production of *parārthānumiti*. Again, is there any necessity to mention the *nigamana-vākya* which is like a conclusion and there have not any novelty from the *pratijñā-vākya*? The Naiyāyikas also say that the *pratijñā-vākya* and the *nigamana-vākya* are not the same, they are different. The person (having *svārthānumiti jñāna*) has presented the cognition of what he gets in *pratijñā-vākya*, and *nigamana-vākya* is like a conclusion of the other person. Now, a conclusion cannot be a component of an inferential statement, conclusion is itself a cognition, valid cognition (*pramā*). Hence, the acceptance of *upanaya-vākya* and *nigamana-vākya* is not a wise one as it brings logical cumbrousness (*gaurava*). So,

only three components of inferential statements should accept in *parārthānumiti* for the sake of logical economy (*lāghava*)[164].

There is a very conducive cause for the Kumārila, which is significantly associated with their definition of cognition. Kumārila does not accept probandum (*sādhya*) in inferential cognition as either probandum alone or *pakṣa* alone, but the *pakṣa,* which is qualified by the probandum. We may explain this with the help of an example. In the case of inferential cognition, we infer neither the hill nor the fire, but the hill which is possessing with the fire, i.e., fiery hill. The relationship between smoke and fire is already known since the time of the cognition of invariable concomitance (*vyāpti*). The hill is known by perception. The cognition of probandum and *pakṣa* are already known previously. So, if we infer the probandum in the *pakṣa,* then the cognition of probandum alone cannot produce the cognition. If so, then such type of cognition cannot be *pramā*. Because, according to Bhāṭṭa Mīṁāmsakas, *pramā* should be something new from what is previously known. In the present context, the hill previously is known, but the fiery hill was not known previously – the fiery hill is known through the *vyāpti*. We infer the fiery hill from the smoky hill, which is perceived. So, the probandum has two forms, viz. *gamaka* and *gamya*. The known form of probandum is called *gamaka*, and the form of probandum, which was previously unknown, is called *gamya*. So, the necessity of *upanaya* in *parārthānumiti* is not tenable. In this way, the Mīmāṁsakas and Advaita Vedāntins are refuted five-statement of components of *parārthānumiti* and accepted three statements of components of *parārthānumiti*, a type of *anumiti* (inferential cognition).

5.2.3.5 Ascertainment of *Vyāpti*:

Vyāpti is invariable concomitance between probans and probandum. Now the question arises that how the ascertainment of *vyāpti* is possible? Regarding this question, different philosophers have taken their position differently. However, it has already been mentioned that Kumārila Bhaṭṭa and Advaita Vedānta schools accept the

---

[164] Here, we have used the term logical economy to denote '*lāghava*', though there are authors who have used the term logical remission or logical parsimony for '*lāghava*'.

reciprocal pervasion (*bhūyodarśana*) for the ascertainment of *vyāpti*. But, Prabhākara Miśra accepts one-time perception for the ascertainment of *vyāpti*. Now, is there any necessity to accept reciprocal pervasion (*bhūyodarśana*) as one-time perception that is enough for ascertaining *vyāpti*? In response to this question, Prābhākara Mīmāṁsakas say there is a necessity to accept reciprocal pervasion (*bhūyodarśana*) to remove the extraneous adjunct (*upādhi*).[165] Someone may raise that only reciprocal pervasion (*bhūyodarśana*) is not enough for ascertaining the *vyāpti*. That is why, Cidānanda, a Bhāṭṭa Mīmāṁsaka, states that *reductio-ad-absurdum* (*tarka*) is also an auxiliary condition for the ascertainment of *vyāpti*.[166] *Reductio-ad-absurdum* (*tarka*) is a method through which doubt of deviation of the invariable concomitance between probans and probandum can be removed. Sucaritāmiśra acknowledges three stages for the ascertainment of *vyāpti* viz. the cognition of *vyāpti*, confirmations of *vyāpti* through a uniform negative experience, and the process of reasoning. But, Pārthasārathi criticizes the Sucaritāmiśra views. According to him, *vyāpti* cannot be an object of perception as it is a permanent relationship between two occurrences, probans and probandum, which is known through reciprocal pervasion (*bhūyodarśana*).

According to Annaṁbhaṭṭa, *vyāpti* (invariable concomitance) can be ascertained through *bhūyodarśana* (reciprocal pervasion). The meaning of *bhūyodarśana* is visited repeated companionship. Now a question arises: how many times has the companion visit been meant by the word 'repetitive'? Because the term '*bhūyodarśana*' refers to the repeated companionship, and then each and every time of companionship can be ascertained of *vyāpti* or accompanied of all companionships. In this regard, Annaṁbhaṭṭa says that one should accept the connotative meaning of the term '*bhūyodarśana*', and ignore the denotative meaning. The connotative meaning of '*bhūyodarśana*' is the cognition of association between probans and

---

165 "*Prābhākarastu-dhūmasyāgnisambandhaḥ sakṛddarśanādevāvagamyata iti sakṛddarśanagamyaiva vyāptiḥ. Upādhiśaṁkā-nirāsārthameva tu bhūyodarśanamarthyate ityāhuḥ*." *Mānameyodaya*, 28-07, p. 60

166 "*... Cidānandaḥ-na kevalaṁ bhūyobhidarśanaistādṛśa naistādṛśamavadhāraṇaṁ sidhyati iti pramāṇotpattyanuguṇastarko'pi tatra sahakārī bhavati iti*". Ibid., p. 60.

probandum accompanied by the absence of awareness of any exception (*vyabhicāra*) is ascertained to the cognition of *vyāpti* (invariable concomitance).[167] In the same way, Dharmarājā Adhvarīndra says in his *Vedānta-Pribhāṣā*, "*sā ca vyabhicārājñāna sati sahacāra-darśanena gṛhyate*", *vyāpti*, between two phenomena, probans and probandum, is known to co-exist with probans and probandum, and at the same time, it is never known any exception. This is why Advaitins are said, "… for ascertaining a universal concomitance it is not essential that observation should be repeated several times; even a single observation can yield the knowledge of such concomitance, *only if* no exception to it is known."[168]

Therefore, Nyāya, Kumārila Bhaṭṭa, and Advaita Vedānta schools accept reciprocal pervasion (*bhūyodarśana*) for the ascertainment of *vyāpti*. Again, they also accept *tarka* (reductio-ad-absurdum) as necessary conditions for ascertaining *vyāpti* (invariable concomitance). However, there is a long discussion regarding the ascertainment of invariable concomitance (*vyāpti*), but we will not go into this matter to focus on our concern subject.

5.2.3.6 Classification of *Vyāpti*:

Nyāya and Mīmāṁsā schools have unanimously accepted two sorts of *vyāpti* viz. *viṣamavyāpti* (non-equipollent concomitance) and *samavyāpti (*equipollent concomitance). Where the probans and the probandum are not co-wider, is called *viṣamavyāpti* (non-equipollent concomitance). When we infer fire from smoke, it is an instance of *viṣamavyāpti* (non-equipollent concomitance). Because fire is wider than smoke in the sense that all the instances of smoke are the cases of having fire but not vice-versa. In the case of *samavyāpti* (equipollent concomitance), both the probans and the probandum are co-wider. Say, for example, '*ghataḥ abhidheyaḥ prameyatvāt,*' i.e., the *ghata* is namable because of its knowability. One may infer

---

[167] "*vyabhicāra-jñāna-viraha-sahakṛta-sahacāra-jñānasya vyāpti-grāhakatvāt*." *Tarkasaṁgraha-Dīpikā*: 52.

[168] Datta, D. M. *The Six Ways of Knowing*, University of Calcutta, Kolkata, 2014, p. 176.

namability from the knowability and the vice-versa. Because every namable thing is knowable in the world, and that is why the inter-exchange of the location of the subject and predicate yields the same truth value of the sentence/statement.

Moreover, *vyāpti* is of two kinds viz. *anvaya-vyāpti* (positive concomitance) and *vyatireka-vyāpti* (negative concomitance). *Anvaya-vyāpti* is the relationship between the co-presence of the probans (*hetu*) with the probandum (*sādhya*). *Vyatireka-vyāpti* is the co-presence between the absence of the probandum (*sādhya*) with the absence of the probans (*hetu*)[169]. Here, an objection may arise. We know that in the case of *parārthānumāna* when someone presents the five sentences (*pañca avayava*-s) to a person to establish the probandum with the help of the relationship of the probans and probandum who does not have the cognition of such and such type of relation to make him understand, the first person presents an example (*udāharaṇa-vākya*), i.e., where there is probans, there is the presence of probandum. It is already mentioned that such type of *vyāpti* is called *anvaya-vyāpti* and generally does not present any instance of *vyatireka-vyāpti*. In most of the inferences, where example (*udāharaṇa*) is given through the help of *anvaya-vyāpti* (positive concomitance) instead of *vyatireka-vyāpti* (negative concomitance). A possible and acceptable answer may be that we, the arguer, always prefer to present concrete ostensive examples that are acceptable to others instead of non-apprehensible/imperceptible instances. *Anvaya-vyāpti* (positive concomitance) is more accessible than *vyatireka-vyāpti* (negative concomitance). So, if it is possible to present an acceptable instance, why should one present non-apprehensible/imperceptible instances? In the case of *parārthārnumāna*, it is easy to mention *anvaya-vyāpti* (positive concomitance) instead of *vyatireka-vyāpti* (negative concomitance). Though it does not recommend that there is not any instance of *vyatireka-vyāpti* (negative concomitance).

---

[169] "*tadbhāve tadbhāvaḥ*".

5.2.3.7 Kinds of *Anumāna* based on *Vyāpti Niścaya*:

Based on these two sorts of *vyāpti* (invariable concomitance), Uddyotkara classifies inference into three types in his *Nyāyavārttika* viz. 1. *Anvayavyatirekī*, 2. *Kevalānvayī* and 3. *Kevala-vyatirekī*[170]. He is the first Naiyāyika who classifies inference in this way, and later on, all Naiyāyikas have followed it.

1. *Anvayavyatirekī*: An inference, when the probans (*hetu*) is both positively and negatively related to its probandum (*sādhya*), is called *anvayavyatirekī anumāna*. When someone infers fire from smoke is an example of *anvayavyatirekī* inference. In the case of *anvayavyatirekī* inference, we find both positive and negative concomitances. Whatever is in possession of probans, will also be in possession of probandum, which is called positive concomitance. Where there is smoke, there is fire, an instance of positive concomitance. Whatever there is the absence of probandum, there will also be the absence of probans which is regarded as negative concomitance. For example, when the fire is absent, there will also be the absence of smoke. This is an example of an instantiation sentence or *udāharaṇa-vākya* of *anvayavyatirekī anumāna*, where probandum tested both positively and negatively.

2. *Kevalānvayī*: An inference, when the probans (*hetu*) is only positively related to its probandum (*sādhya*), is called *kevalānvayī anumāna*. Say, for example, '*ghaṭaḥ abhidheyaḥ prameyatvāt, paṭavat*', i.e., the pot is nameable, because it is knowable, like cloth. Here, only the positive concomitance between the knowability (probans) and the namability (probandum) would observe. In this case, the negative concomitance will not be possible. Because it is true to say that whatever is namable, is also knowable, but the absence of vice-versa, i.e., whatever is not knowable is not namable, is not possible.

---

[170] *Nyāyavārttika*: 1-1-5.

3. *Kevala-vyatirekī*: An inference, when the probans (*hetu*) is only negatively related to its probandum (*sādhya*), is called *kevala-vyatirekī anumāna*. This inference is only dependent on negative concomitance. We can take the most famous example, '*pṛthivī itarebhyaḥ bhidyate gandhavattvāt*', i.e., the earth is different from other elements, because it has a smell. The instance of negative invariable concomitance would be put forward as 'whatever is not different from other entities has no smell' (like water, fire, etc.). Contrarily, if we set up a positive concomitance, i.e., 'whatever is having smell would be different from non-earth'. And by posing this instance, we cannot produce an example as all varieties of the earth come under *pakṣa*, i.e., the earth.

Gāgābhaṭṭa, a Mīmāṁsaka, mentions three sorts of *anumāna* like Udayana in his *Bhāṭṭacintāmaṇi*. However, Nārāyaṇa Bhaṭṭa, in his *Mānameyodaya*, mentions these three sorts of *anumāna* after Cidānanda and accepts only *anvayī anumāna* followed by Kumārila. Kumārila Bhaṭṭa refutes the *vyatirekī anumāna* and accepts *arthāpatti* in place of *vyatirekī anumāna*. Accordingly, he did not admit *anvaya-vyatirekī* in the way as he refutes *vatirekī anumāna*. This is why Kumārila Bhaṭṭa accepts only one sort of *anumāna*, i.e., *anvayī*. It is essential to point out that more or less this discussion is much essential as the independency of *arthāpatti* as an instrument of valid cognition is dependent on the existence of *vyatirekī anumāna*.

5.2.3.8 Contention on *Kevala-Vyatirekī Anumāna*:

The Mīmāṁsakas have refuted the *kevala-vyatirekī anumāna*. They have accepted *arthāpatti* in place of *kevala-vyatirekī anumāna*. The argument to refute *kevala-vyatirekī anumāna* is as follows: in inference, the *pakṣa* is used as a *viśeṣya* and *sādhya* is used as a *viśeṣaṇa*. The hill is treated as *pakṣa*, and the fire is treated as *sādhya* in the *anumāna* of '*parvato vahnimāna dhūmāt*'. In an *anumāna*, the *sādhya* should always be previously known as a *viśeṣaṇa* to a *viśeṣya*. But, in the case of *kevala-vyatirekī anumāna*, the *sādhya* is not previously known as a *viśeṣaṇa* to a *viśeṣya*. As the *sādhya* is unknown concerning its relation with the *hetu*, how the inferential cognition (*anumiti*) can confirm the *sādhya* to such inference? For example, the inferential formation: 'cognition is self-illuminating (*svaprakāśa*),

because it has knowability (*jñānatva*)'. The self-illuminating (*svaprakāśatva*) character of cognition is not a case of previously known fact, i.e., *prasiddha*. But, according to Kumārila, cognitionhood is always inferable (*anumeya*). Hence, the *kevala-vyatirekī anumāna* is not possible due to the unavailability of instance/instances of self-illumination (*svaprakāśa*) in cases of cognition.

The Bhāṭṭa Mīmāṁsakas refuse the *kevala-vyatirekī anumāna* due to the defect of *aprasiddhatva* (unestablished entity) of the *sādhya*. To refute the *kevala-vyatirekī anumāna* of the Naiyāyikas, Nārāyaṇa Bhaṭṭa in his *Mānameyodaya* has given an example of *kevala-vyatirekī anumāna* as follows: '*sarvaṁ jñānaṁ svaprakāśam jñānatvāt*'[171]. This sort of inference may be possible only through the establishment of *vyatireka vyāpti* as '*yasya svaprakāśatvaṁ nāsti tasya jñānatvamapi nāsti*, *yathā ghaṭasya iti*'[172]. This example of *vyatireka vyāpti*, according to the Bhāṭṭas, is a faulty one. It is a known fact that an object can be the subject of an *anumāna* only when it is previously known as a *viśeṣaṇa* to a *viśeṣya*, i.e., *anyatra-prasiddha*. When we come to infer fire on the hill, it is necessary to have the cognition of fire in some other place like the kitchen, etc. The Bhāṭṭas made the point that when the fire is known in the kitchen, it is not that fire alone but its relation with the kitchen. Subsequently, if the invariable concomitance relationship between smoke and fire is established, what is called the relationship between probans and probandum, i.e., *vyāpti*, then one can infer the fire on the hill. But in the present case of *kevala-vyatirekī anumāna*, the probandum *svaprakāśatva* is not an instance of *anyatra-prasiddha.* The Bhāṭṭas denote this sort of fault as *aprasiddha-viśeṣaṇatā*. So, as it is impossible to know the *svaprakāśatva* somewhere; we cannot have the cognition of *vyāpti* between the *jñānatva* and the *svaprakāśatva*. According to the Bhāṭṭas, cognition is always *anumeya* but *svaprakāśatva* of cognition is an unestablished fact (*anyatra-aprasiddha*). So, the inference, 'cognition is self-illuminating (*svaprakāśa*), because it has knowability (*jñānatva*)' is a faulty inference. Moreover, according to Naiyāyikas, the aforementioned example what is mentioned by Nārāyaṇa Bhaṭṭa is not a proper one as it is not free from fallacy due to the

---

[171] *Mānameyodaya*: 38-17, p. 93.

[172] Ibid., p. 93.

anupasaṁhārī hetvābhāṣa, because '*sarvaṁ*' can never be a *pakṣa* of an *anumāna*. However, the cognitionhood through probans of *svaprakāśatva* cannot generate any cognition as it is an unestablished fact (*anyatra-aprasiddha*), and that is why Kumārila Mīmāṁsakas also deny in the case of *arthāpatti* (presumption). According to Kumārila, *svaprakāśatva* is not established anywhere, so it cannot be a subject of the valid cognition of *arthāpatti* (presumption).

Now, let us discuss the refutation of the *kevala-vyatirekī anumāna* due to the defect of *aprasiddhatva* (unestablished entity) with the help of just mentioned example by Naiyāyikas. Naiyāyikas has given an example of *kevala-vyatirekī anumāna* as '*pṛthivī itarebhyaḥ vidyate gandhavattvāt*', i.e., the earth is different from other elements, because it has a smell. According to Naiyāyikas, this sort of inference is possible only through the *vyatireka vyāpti* as 'whatever is not different from other entities has no smell' (like water, fire, etc.). Contrarily, if we set up a positive concomitance, i.e., 'whatever is having smell would be different from non-earth'. And by posing this instance, we cannot produce an example as all varieties of the earth come under *pakṣa*, i.e., the earth. This example, according to the Bhāṭṭas, is not the right one. We know that an object becomes the subject of inferential cognition only when it is previously known somewhere (*anyatra-prasiddha*). When we come to infer fire on the hill, it is necessary to have the cognition of fire in some other place like the kitchen, etc. The intention of Bhāṭṭas has pointed out that when the fire is known in the kitchen, it is not that fire alone, still, it is identified with the relationship between smoke and fire, what is called *vyāpti* (invariable concomitance). Subsequently, one continues to infer the fire on the hill due to the *sādhya* is previously known in the kitchen (*anyatra-prasiddha*). Yet, in the present case of *kevala-vyatirekī* is not as such a probandum as *itarebhyaḥ vidyatva*. Bhāṭṭas have called the fault *aprasiddha-viśeṣaṇatā*. So, as it is impossible to know the *itarebhyaḥ vidyatva* somewhere; we cannot have the cognition of *vyāpti* between the *gandhavattvātva* and the *itarebhyaḥ vidyatva*. Bhāṭṭas say that *itarebhyaḥ vidyatva* is unestablished somewhere (*anyatra-aprasiddha*).

Some of the Naiyāyikas felt that the difficulty mentioned above could be removed through the help of favorable *tarka* (reductio-ad-absurdum) which is related to the cause-and-effect relationship. But this observation is not accepted by the

Bhāṭṭas because of the non-establishment of something (*anyatra-aprasiddha*). Say, for example: when the horn of a horse is non-existent or not known, then *tarka* cannot help anything else. So, as the process of *kevala-vyatirekī anumāna* is related to the fault of *aprasiddhatva*, it cannot be accepted as the sort of *anumāna*.[173]

However, Naiyāyikas counters the view of Bhāṭṭas. They have pointed out that when we talk about *vyāpti*, we consider both the forms of invariable concomitance (positive and negative invariable concomitance). According to them, without the negative concomitance, the ascertainment of *vyāpti* cannot be possible.[174] *Vyāpti* can be more authentic through the negative concomitance what is called *vyavicāra-adarśana*. It helps *vyāpti* to remove the inconsistency or *vyabhicāra*. This can be illustrated with the help of the well-known example of *vyāpti*. The regular co-existence of smoke (probans) and fire (probandum) is called *vyāpti*. We also see different places where smoke and fire are present through perception. After this cognition, if we stop observing the perception of smoke and fire, we may not be able to establish the actual relationship between them. So, according to Naiyāyika, to establish the exact relationship between smoke and fire, one has to know that both of them are absent, i.e., whatever the absence of fire is absent of smoke like the lake, etc. We can establish the relationship of *vyāpti* between smoke and fire through such types of positive concomitance (*anvaya vyāpti*) and negative concomitance (*vyatireka vyāpti*). This is why Naiyāyikas say that *anvaya* and *vyatireka* both are the essential for *vyāpti* as both are ground of probans, "*api ca tena vinā nopapadyate iti ca vyatirekabhaṇitiriyaṁ vyatirekaśca pratītaḥ tasmin satyupapadyate ityanvayamākṣipati*."[175] According to Naiyāyikas, if one accepts only positive concomitance (*anvaya vyāpti*) and does not accept negative concomitance (*vyatireka vyāpti*), then the validity of *vyāpti* cannot be established. Because through this acceptance, one has to accept there may be smoke without fire. This is not possible.

---

[173] "*tarko hi nāprasiddhārthaṁ kvacit sādhayituṁ kṣamaḥ. / ato'prasiddhatādoṣastarke satyapi dustyajaḥ*." *Mānameyodaya*: 38-17, p. 93

[174] *vyavicāra-adarśana*.

[175] Bhaṭṭa, Jayanta. *Nyāyamañjarī*, Sanjit Kumar Sadhukhan (El.), Sadeśa, Second Edition: 2015, Kolkata, p. 152.

This cognition is called *vyabhicāra-jñāna*, which is not allowed the cognition of the *vyāpti*. So, one has to accept negative concomitance (*vyatireka vyāpti*) to remove the inconsistency (*vyabhicāra*) and prove that smoke never exists without fire.

In our preceding discussion, the study has shown the justification for accepting the *vyatireka vyāpti* is not taking over at all. Because we know that Naiyāyikas also accept *tarka* (reductio-ad-absurdum) as a tool for justification, i.e., an accessory cause of valid cognition. One can remove the inconsistency (*vyabhicāra*) by applying *tarka* (reduction-ad-absurdum) or indirect proof. *Tarka* or indirect proof is a method that can be applied in many cases to establish the right one. *Tarka* (*reductio-ad-absurdum*) is that which counters the opposite position (*vipakṣavādhaka*). The definition of *tarka* is given in *Nīlakanṭhiprakāśikā* on *Dīpikā* of *Tarkasaṁgraha* as: "*āhāryavyāpakavattābhramajanya āhāryāpyāvattābhramastharkaḥ*"[176], i.e., *tarka* is an imposed (*āhārya*) erroneous cognition of the existence of the pervader (*vyāpaka*), which is produced by another imposed (*āhārya*) erroneous cognition of the existence of a pervaded (*vyāpya*). The cognition, which is produced out of one's desire at the time when there is a contrary cognition, is called *āhārya jñāna* or imposed cognition.[177] If the form of the cognition is: 'There is fire in the lake' (*hrado vahnimān*) is created out of one's desire at the time when there is the existence of the contrary cognition in the form: 'There is the absence of fire in the lake' (*hrado vahnyabhāvavān*), it is called an imposed cognition (*āhārya-jñāna*). This *tarka* is of two sorts viz. *viṣayapariśodhaka* and *vyabhicāraśamkānivartaka*. The structure of *viṣayapariśodhaka* is: 'If it has no fire, it has no smoke' (*yadyam vahnimānna syāttadā dhūmavān na syāt*) establishes the certainty of fire in the hill. In this way, the certainty of *vyāpti* can be established.[178] The form of *vyabhicāraśamkānivartaka* is: 'if smoke deviates from fire, it will not cause by fire' (*dhūmo yodi vahnivyabhicārī*

---

[176] Annaṁbhaṭṭa, *Tarkasaṁgraha* with *Dīpikā* (with seven commentaries), Ed. By Satkari Sarma Bangiya, Chowkhamba, 1976, p.235.

[177] "*virodhijñānakālīnecchāprayojyajñānatvam āhāryajñāna*."

[178] *Bhāṣāpariccheda* verse no. 137.

syāt tarhi vanhijanyo na syāt). So, through this sort of *vyāpti*, the deviation of probandum in probans is removed.

The second form of *tarka*, *vyabhicāraśamkānivartaka*, is also known as *āpatti*. It is the origination of the undesired by which the desire is established. It is also a sort of indirect method by which the truth can ascertain. If the negation of P is proved as absurd, it would automatically follow that P is true (~ P, ~ ~ P, ∴ P). So, one cannot say that we should accept *vyatireka vyāpti* instead of *tarka* because the field of *tarka* is larger than the *vyatireka vyāpti*. Now a question arises if we remove the *vyabhicāra* in the field of *vyāpti* through *tarka*, then why do we need to accept the *vyatireka vyāpti*?

In this context, Naiyāyikas may arise another problem that *tarka* applies to where the *anumāna* functions only in cause-and-effect relationships. But, in some cases where *vyāpti* is with some other types of relation rather than cause-and-effect, *tarka* cannot help such cases to the certainty of *vyāpti*. There are such instances where *anumāna* functions through the help of *vyāpti* in which there has no cause-and-effect relationship. Say, for example, the relationship between the rising moon and the growing tide of an ocean is called *vyāpti*. Here, we cannot apply *tarka* to avoid the doubt about the certainty of *vyāpti*. In such cases, Naiyāyikas also accept another type of perception, i.e., *sāmānyalakṣaṇa pratyakṣa*, by which the validity of *vyāpti* can be established. By *sāmānyalakṣaṇa pratyakṣa*, we perceive all of the past, present, and future entities of a class through its universality. When we perceive a specific smoke and a specific fire in the kitchen, we also perceive their universals like 'smokeness' and 'fireness', which are inherent of smoke and fire. We perceive all the specific smoke and fire universally through this *sāmānyalakṣaṇa pratyakṣa*. So, by using the *sāmānyalakṣaṇa pratyakṣa*, the validity of *vyāpti* between probans and probandum can be adopted. So, again the acceptance of the necessity of *vyatireka vyāpti* is questionable.

In this context, Śridhara, a commentator of *Praśastapāda-Bhāṣya*, gives a reasonable response. He opines that if we closely scrutinize the classification of *anumāna* through the basis of *vyāpti*, *vyabhicāra* has no scope for its incidence. For the case of positive concomitance, a well-known example is: '*viśeṣo'bhidheyaḥ*

prameyatvāt, sāmānyavat'. In this example, the probans 'knowability' is only positively related to its probandum 'namability' as there is no negative concomitance. So, there is no room for the arising of the *vyabhicāra* between the relation of knowability and namability. One may raise the following arrangements as the cause of *vyabhicāra*:

1. There may be knowability without the namability.
2. There may be namability without the knowability.

It is true to say that both the arrangements are not the instance of *vyabhicāra*. In the first instance, the absence of namability itself is namable, and hence, it is knowable. In the second instance, the absence of knowability itself is knowable, and hence, it is namable. So, there is no *vyabhicāra* between the two.

Similarly, for the case of negative concomitance, the example is: '*jīvavat śarīram sātmakam prāṇādimatvāt*', i.e., whatever is not with the soul, is also not with life, like pot. Here, the probans '*prāṇādimtva*' stay on only with the probandum '*jīvavat śarīram sātmakam*'. Hence, positive invariable concomitance is not applicable. There is no room for the arising of the *vyabhicāra* between the two as the dissimilar instance (*vipakṣa dṛśṭānta*) viz. a pot, in which neither *prāṇādimatva* nor *sātmakattva* remains. That is why the *vyabhicāra* is not always occurred.

Udayana, a Naiyāyika, refutes the causality of the negative concomitance. According to him, the positive concomitance is singly the cause of *anumāna*. He observes that if the *vyatireka vyāpti* were admitted as the cause of *anumāna*, it would create inconsistency in the case of *kevalānvayī anumāna*. Because *kevalānvayī anumāna* does not have negative concomitance, it has only a positive concomitance.[179] Again the question arises: Is the cognition of *kevalānvayī anumāna* not certain? Though, Udayana accepts that the negative concomitance is the cause of *anumāna* in general through the help of *anvaya-sahacāra* (positive co-existence). Still, it is questionable for the acceptance of *kevalānvayī* as it has no *vyatireka vyāpti*.

---

[179] "*anumitisāmānye anvaya-vyāptijñānam eva kāraṇam, natu vyatireka-vyāptijñānam api, anyathāsiddhatvāt kevalānvayitva-graha-kālīnānumitau vyabhicārac ca iti ācāryāśayaḥ*." *Kiraṇāvalī*.

The preceding discussion is the cause of acceptance of the *vyatireka vyāpti*. Naiyāyikas is mentioned especially for the validity or the certainty of *vyāpti*. One should accept the *vyatireka vyāpti*. To clearly be to say that for the removal of *vyabhicāra jñāna*, one should take *vyatireka vyāpti*. However, it is shown that the *vyābhicāra* can be removed by the application of *tarka* (reductio-ad-absurdum). And, it is also demonstrated that all the time, *vyābhicāra* doesn't arise. Hence, our observation regarding this is the acceptance of *vyatireka vyāpti* is not tenable. Therefore, the acceptance of *kevala-vyatirekī anumāna* is not acceptable as it is dependent on *vyatireka-vyāpti*.

Furthermore, the probans (*hetu*) implies the probandum (*sādhya*) in the case of *kevalānvayī anumāna* (probans ⊃ probandum). However, the negation of probandum implies the negation of probans in the case of *kevala-vyatirekī anumāna* (~ probandum ⊃ ~ probans). Now it is essential to point out that such types of implications are equivalent in Logic. They are logically equivalent. So, the question comes: if the Indian philosophers give importance to the logical economy (*lāghava*) to avoid logical cumbrousness (*gaurava*), then why are they accepted such types of equivalencies differently. Therefore, one should take only one alternative from both (*kevalānvayī anumāna* or *kevala-vyatirekī anumāna*) to stand for the logical economy (*lāghava*).

In the case of *vyāpti* (invariable concomitance), probans is always related to probandum; probans cannot exist without probandum. So far, our concerning example, smoke is always presented with fire; smoke cannot exist without fire. However, in the case of *arthāpatti* (presumption), there is not any necessary relationship between *upapādaka* and *upapādya*.

5.2.4 Contention between Nyāya and Advaita Vedānta on *Arthāpatti*:

The Naiyāyika's reduction of *arthāpatti* (presumption) in *anumāna* (inference) cannot be accepted as a proper view. This can be substantiated through the *Vedānta-Paribhāṣā*. Dharmarājā Adhvarīndra in his *Vedānta-Paribhāṣā* refutes the view of Naiyāyikas regarding *arthāpatti* (presumption). He shows that *arthāpatti*

(presumption) cannot be reduced to *anumāna* (inference). He says that if *arthāpatti* (presumption) is a case of an *anumāna* (inference), then it must be *anvayī* type (agreement in presence) or the *vyatirekī* type (agreement in absence). But, Dharmarājā Adhvarīndra shows that it cannot be an *anvayī* type of *anumāna* (inference). In the case of inference of the *anvayī* type which is based on *anvaya vyāpti*, we have for its major premise a proposition that is expressing a direct relationship of universal concomitance between the probans and the probandum. However, as a matter of fact, we cannot have for its major premise, in *arthāpatti* (presumption), a proposition showing a direct relationship of universal concomitance between the probans (the aliveness of Devadatta accompanied by the non-existence of him in the house) and the probandum (the existence of Devadatta outside the house). The body of Devadatta cannot be equated with a place where the relation of invariable concomitance can be established simply because his body stands for the subject (*pakṣa*). The body of Devadatta, there is the existence of the probans, i.e., the aliveness of Devadatta accompanied by the non-existence of him in the house. But there is no probandum, i.e., the existence of Devadatta outside the house. Thus, we see that one of the terms, probandum, is absent from the body of Devadatta. Therefore, it is evident that there cannot be an invariable concomitance between the probans and the probandum in the body of Devadatta. The cognition of the same, i.e., the *vyāpti* (invariable concomitance), cannot be established in places other than the body of Devadatta because the other places are like the subject in question. Consequently, in other places also there may be certain about the presence of the probans, but there cannot be certain about the presence of the probans and probandum. In this way, Dharmarājā Adhvarīndra shows that *arthāpatti* (presumption) cannot be reduced to the inference of *anvayī* type. For supporting the view that *arthāpatti* (presumption) is not an *anvayī* type, Annaṁbhaṭṭa also says, "… no Rule of positive concomitance, i.e. one supported by instances of 'anvaya' or agreement in presence is available here".[180]

Furthermore, it is important to point out that Advaitins like Dharmarājā Adhvarīndra has refuted the *kevalānvayī* type of inference (agreement in presence)

which is accepted by the Naiyāyikas. They have said that *kevalānyī anumāna* is based on a metaphysical standpoint which is not at par with the Advatins metaphysical stand point. This can be illustrated by D.M. Datta, "There can be no term which is all-pervasive, and the absence of which cannot be found anywhere. Brahman, as conceived by them, excludes all predicates and the absence of the so-called all-pervasive major term (like "knowable") can be shown at least in Brahman."[181]

The *kevala-vyatirekī anumāna*, according to Naiyāyikas, is generated when the probans (*hetu*) is only negatively related to its probandum (*sādhya*). But Advaitins argue that "An argument based on an invariable concomitance between the *absence* of the major term and the *absence* of the middle (as we have in a vyatireki induction) cannot, therefore, be called an *anumāna*, though it may be a quite valid piece of knowledge. It should be given a separate name, viz. *arthāpatti*."[182] So, a *vyātirekī* type of *anumāna* can't be treated as proper *anumāna*. There is no *anvaya-vyatirekī anumāna* as there is no existence of *vyatirekī anumāna*. However, Advaitins accept only one type of inference, i.e., *anvayi-rūpamātra*.

If there is not any inferential cognition to ascertain the invariable concomitance of *vyatireka-vyāpti*, and those who do not have the cognition of *anvaya-vyāpti* in smoke, then in that situation how can inferential cognition of fire be possible through the cognition of *vyatireka-vyāpti* of smoke? In that case, Advaitins have said that it is possible due to the *arthāpatti-pramāṇa*. The person who has not the cognition of certainty about *anvaya-vyāpti*, the person can't know that smoke is pervaded (*vyāpya*). However, the person has the cognition that smoke is produced from fire, smoke is not produced without fire. Such type of inconsistency is called *arthāpatti pramāṇa*. Later on, seeing the smoke in the hill which is otherwise not generated, the person assumes the existence of fire in the same hill. Such type of assumption is not inference because it is not produced through any cause of inference, rather it is produced through the instrument of *arthāpatti*, and that is why it is *arthāpatti*. Advaitins have represented the causal explanation of invariable

[182] Ibid., p. 187.

concomitance like the logical entailment theory. In logical entailment theory, we have seen that there is a certainty, which is also existed in the case of invariable concomitance as accepted by the Advaitins. The Advaitin's causal explanation of invariable concomitance have a certainty which has seen in the logical entailment theory. However, it is important to point out that the person who has the cognition of *anvaya-vyāpti* in the smoke, have known the smoke as a pervaded (*vyāpya*). Later, when he will have the cognition of fire after seeing the smoke in the hill, etc., then such type of cognition is inference.

Dharmarājā Adhvarīndra has produced another sound argument to substantiate the view that *arthāpatti* (presumption) cannot be a case of inference. According to him, we are quite conscious about the instrument to ascertain cognition whenever we know something, say, for example: 'If we know through the perception that the table in front of me is brown, then at the same time we also know that we are having the cognition of the colour of the table through perception'. But, if, on the other hand, we know the presence of the fire in the hill through inference, then we also know that we have the cognition of the presence of fire in the hill through inference. According to him, none of the cases of *arthāpatti* that we have mentioned earlier are followed by a subsequent cognition (*anuvyavasāya*) "I am inferring" (*anuminomi*), but on the contrary, we say "I am assuming" (*kalpayāmi or arthāpayāmi*)[183]. So, this argument proves, once again, that *arthāpatti* (presumption) is not a case of inference.

Dharmarājā Adhvarīndra says that if *arthāpatti* (presumption) is an inference, it must be of the *vyatirekī* type (agreement of difference). However, *vyatirekī anumāna*, he shows, is not a case of inference in the true sense of the term. Therefore, for the same reason, *arthāpatti* (presumption) cannot be recognized as a case of *anumāna* (inference) proper. It is important to note that Naiyāyika reduces *arthāpatti* (presumption) to the *vyatirekī* type of inference. Both of the instances of *arthāpatti* (presumption) already mentioned can be rendered in the *vyatirekī* form in the following way. The argument that the man who does not take food in the day time and yet remains stout must eat at night may be rendered in the form:

---

[183] "*ata evārthāpattisthale'numinomīti nānuvyavasāyaḥ, kintvanenedaṁ kalpayāmīti*." *Vedānta-Paribhāṣā*, p. 220.

> 'No case of absence of eating at night while fasting by day is a case of stoutness.
> This is a case of stoutness.
> Therefore, this is not a case of the absence of eating at night while fasting by day, i.e., this is a case of night eating.

Likewise, the instance of *arthāpatti* (presumption) given by the Mīmāṁsakas that Devadatta is alive and yet not at home, he must be outside may be put into the following form:

> 'No case of absence of a man outside the home, while he is not also at home, is a case of his being alive.
> Devadatta is alive.
> Therefore, he is not absent outside home while he is not at home, i.e., he is outside home'.

As far as our discussion is concerned, it is seen that *arthāpatti* (presumption) is nothing but a case of inference as the Naiyāyikas hold it. To overcome this problem, the Advaitins has restored to his allies the Mīmāṁsakas, especially the Bhāṭṭa. Kumārila Bhaṭṭa, accompanied by his followers, has produced many sound arguments to substantiate the position that *arthāpatti* (presumption) is an independent and separate instrument of valid cognition. The Bhāṭṭa thinkers mention that sometimes contradiction arises in our mind, and to resolve this contradiction, we take the help of *arthāpatti* (presumption). Going back to the well-known examples of *arthāpatti* (presumption) already mentioned, we fall in contradiction when we cannot find Devadatta at home and when we know through some authentic source that 'he is alive'. This contradiction is not resolved unless and until we assume that 'he is outside'. Likewise, conflict arises between the cognitions that a man does not eat during daytime and stout. This contradiction can be resolved only through *arthāpatti* (presumption) because 'he is eating at night'. Here, the very assumption in both of the cases is justified and is a valid piece of cognition, simply because of the fact that the two events between which there is apparent conflict are known to be certain, and again it is only the assumed facts through which the conflict can be explained away. Thus, it is resolved that it cannot be recognized as the case of inference (*anumāna*).

Arthāpatti (presumption) cannot be put into the dais of *anumāna* (inference). We know that in the case of valid inference, some conditions are to be fulfilled. Say, for example, in inference, the probandum is ascertained based on the cognition of the probans. But this is not true in the case of *arthāpatti* (presumption). If *arthāpatti* (presumption) were an *anumāna* (inference), what would be the probans of it? In an *anumāna* (inference), the cognition of the probans necessarily leads to the cognition of the probandum. However, the mere cognition of the absence of Devadatta from whom does not necessarily lead to the cognition that he is outside since he may be dead and thus altogether non-existent. Likewise, the mere cognition of his being alive also cannot be the probans from which the cognition of his being outside can necessarily be deduced since he may be at home. Thus, it is resolved that *arthāpatti* (presumption) cannot be reduced to *anumāna* (inference). Here, the absence of Devadatta from home coupled with the cognition of his being alive serves as the mark from which the fact of his being outside can be inferred. But, the relation of these two facts constituting the probans is impossible unless and until it is assumed that he is outside; otherwise, the conflict between the fact that he is alive and not at home, cannot be resolved. Thus, it is seen that here the cognition of the probans presupposes already the cognition of the fact to be proved, and nothing remains to be proved by inference. In this way, it can be resolved that the attempt to reduce *arthāpatti* (presumption) to *anumāna* (inference) becomes the subject of being vitiated by the fallacy of circularity (*petitio principi*).

5.2.5 Contention between Nyāya and Bhāṭṭa Mīmāṁsā on *Arthāpatti*:

Nārāyaṇa Bhaṭṭa, a Bhāṭṭa Mīmāṁsaka, says on *arthāpatti* (presumption) as, 'when something is otherwise unintelligible, the assumption of what will make it intelligible is *arthāpatti* (presumption): this alone is the definition as given in the *Bhāṣya*'.[184] According to Nārāyaṇa Bhaṭṭa, here, unintelligibility is nothing but the inconsistency between two instruments of valid cognition. Here, it is essential to note

---

[184] *"anyathānupapattyā yadupapādakakalpanam. / tadarthāpattirityevaṁ lakṣaṇaṁ bhāṣyabhāṣitam". Mānameyodaya*: 56-35-1, p. 195.

that one instrument of valid cognition is common, and the other one is specific. When a common valid cognition comes in conflict with a specific one, the cognition of the non-conflicting element is known as *arthāpatti* (presumption). Here, in the example already given, it is the common or general inference based on astrology through which we know that Devadatta is alive, and the non-existence of Devadatta in his house is known through another specific instrument of cognition which is known as non-apprehension. Here, the former instrument of cognition comes in conflict with the latter one and which leads to the assumption of the presence of Devadatta outside. As far as our discussion is concerned, it can be said that the cognition of the presence of Devadatta outside his house is the valid cognition called *arthāpatti* (presumption), and the instrument of the same is nothing but the inconsistency between the two instruments mentioned above of valid cognition.

According to Dharmarājā Adhvarīndra, the assumption of *upapādaka* based on the cognition of *upapādya* is called *arthāpatti* (presumption). However, it is essential to point out that the term *arthāpatti* (presumption) stands for valid cognition (*pramā*). The instrument of this cognition is the cognition of *upapādya*. But, Nārāyaṇa Bhaṭṭa holds that the conflict between the two instruments, as mentioned earlier of cognition is the instrument called *arthāpatti* (presumption).

The Nyāya school has countered the above view of the Bhāṭṭa school. The Naiyāyikas argue that it is absurd to say that there is a contradiction between two instruments of cognition as the Bhāṭṭa school holds it. The Bhāṭṭa thinkers observe that the dichotomy between two instruments of cognition leads to the assumption of a thing. Still, the Naiyāyikas think that how can a genuine instrument of cognition come in conflict with another genuine instrument of cognition? If there is a contradiction between two instruments of cognition, then we have to think that one of them must be false. Say, for example, if 'I have a cognition that the object I perceive in front of me is silver, then I cannot have the cognition of the same thing as otherwise in the form this is not silver'. Both of them cannot be true at the same time. If the first cognition is taken as true, the second one cannot be true, and the vice-versa. Thus, the Naiyāyikas show that the Bhāṭṭas position that the contradiction between the two instruments of cognition is the un-common cause *(karaṇa)* of the cognition called *arthāpatti* (presumption) cannot be accepted.

In reply to the above objection raised by the Naiyāyikas, the Bhāṭṭas argue that the Naiyāyikas fail to understand the fact that conflict is possible between two instruments of cognition if one of them is general and the other is specific. One instrument of cognition cannot contradict the other instrument of valid cognition if both are specified. But, in the case of *arthāpatti* (presumption), both instruments are not specific, which has already been discussed. So, there is no absurdity to maintain that one instrument of cognition, i.e., the general instrument of valid cognition that Devadatta is alive, conflicts with the specific instrument of valid cognition that his absence in his house.

5.3 Observation:

It is essential to mention that the above position of the Bhāṭṭa school can be substantiated. If we scrutinize, then it can be understood that there is a conflict between the *pramāṇa*-s already mentioned. Why does one assume the existence of Devadatta outside his home? The only logical answer to this question is that because there is an inconsistency between the two *pramāṇa*-s, obviously, one is general, and the other is specific. The existence of the Devadatta outside his house is assumed to resolve the inconsistency in question. Thus, it is seen that the view, as mentioned earlier by the Nyāya school as well as the Sāṁkhya school, cannot be accepted.
